ROUNDTRIP PROCESSES

Camera/Set → DIT / MCR

Digital Cinema Camera → HEDGE → Project Hard Drive/Storage

It is recommended you read a guide to keeping cards and rushes safe before proceeding with reading and undertaking this step. There are important principles to take heed of which can vary depending on the project's delivery requirements and the materials recorded/gathered at the very start of post-production. It is essential you know how to handle different file formats/types and the steps involved.

HEDGE is an industry-standard backup, copying and archival application which simplifies these essential processes and mitigating data errors where possible. You can select your source (which may a camera's memory card, hard drive or other connected source) and your destination (or multiple destinations) (which may be your project's hard drive, media server or other connected destination). Each completed transfer automatically generates a Transfer Log Sheet which is a

permanent text-based record verifying the transfer process which may also be useful as proof of work as a DIT or upon ingesting/delivering files.

There is also an accompanying mobile app which synchronises the progress made on your desktop and is especially useful if you are multi-roleing on-set or are required to be elsewhere or otherwise occupied, so you can be kept updated when transfers are complete and also their current progress.

HEDGE is a paid software which can be downloaded [here](#).

Authoring a DCP from a MASTER Deliverable using DCP-O-Matic 2

Things You need to know:

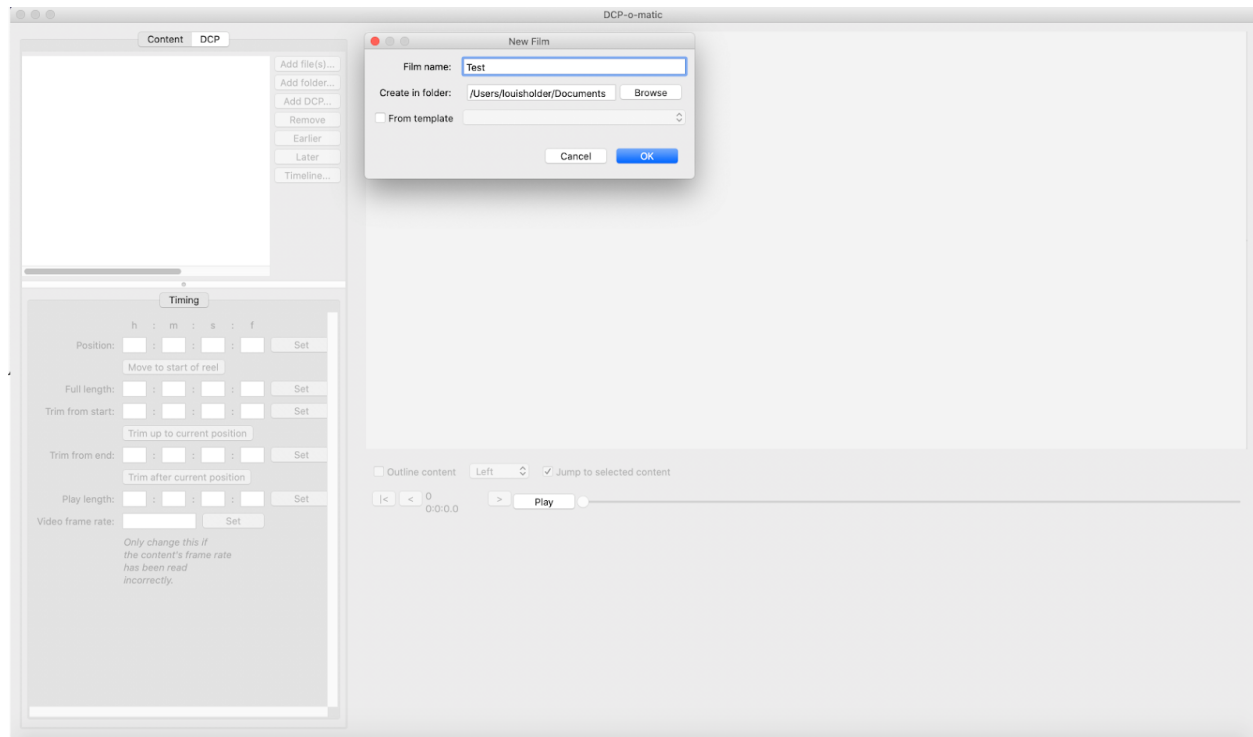

- Cinema Projectors can only ingest and play a certain type of file: a DCP (Digital Cinema Package)
- Cinema Projectors can only recognise certain hard-drive formats: Extended Filesystem (i.e EXT-2)
- DCPs cannot be played or tested using conventional 'media players' like QuickTime or VLC and require specialist applications and hardware. For best results, DCPs should always be tested in an actual cinema.
- Most film festivals require filmmakers to have a DCP deliverable.

How to make a DCP:

- **Step 1: Have Your File Ready**
 - Very simply, you will need to use your master file to make the DCP, which will always output at 2K minimum. Don't worry if your file isn't in 2K Resolution, if your file is in HD, you should create a 2K DCP. Any text/subtitles should be burned in and you should have the relevant sound levels required. Make sure there is no more than 3 secs black at start/end.
 - Ideally your master file should be a QuickTime Apple ProRes File, as it is more than likely you will also be required to submit this type of file as well for festival consideration.
- **Step 2: Open DCP-O-Matic**
 - DCP-O-Matic is a free open-source application that you can download from the internet here.
 - Create a new file, name it, and make sure you know where it's saving.

Software Packages & Version Information

Last Updated: Thursday 12th November 2020

- **Step 3: Add Your File**

- Click Add File and choose your Master File.
- The programme will then check the file automatically and you will be able to see a preview in the window.

Software Packages & Version Information							
DIT / MCR →	Offline Edit →	Grade →	VFX →	Sound →	Deliver →	DCP Deliver →	Upload →
Hedge	Avid Media Composer	DaVinci Resolve	NUKE	ProTools	DaVinci Resolve	DCP-O-Matic 2	Frame.io

● Step 4: Set Your Content

- These are really important - as you can't check the file, you need to be very sure before you create the DCP, that all of the settings are set correctly.
- When setting the content, ensure the preview pane has someone's face in it so you can look out for stretching errors.
- Settings:
 - Type: 2D (Leave Unchanged)
 - Scale To: Set your Aspect Ratio (Only change if necessary)
 - Colour Conversion: Rec. 709 (Leave Unchanged)
- Beware: Files that are 16:9 should be using 16:9 on both tabs as their setting, and the same goes for 1.85:1 etc. I'd only suggest using Full Frame if your film is cropped/masked so the container is actually different to the picture you see. If this is the case you can try different settings (changes viewable in the preview window) until it looks correct.

Last Updated: Thursday 12th November 2020

(Switch to DCP Tab above these settings)

- Rename DCP to film name etc
- Next to 'Use ISDCF name' click Details and change details where appropriate.
- Content Type: Change as Appropriate (i.e Short)
- Leave Everything Else Unchanged
- The 'SMPTE' (ISDCF) name box should always be TICKED too.
- Unless specifically requested by a festival, NEVER tick the 'Encrypt' box - this can prevent cinemas from ingesting the DCP.
- The 'signed' box will not visually affect your DCP, however I would always UNTICK this as it prevents the DCP from being manipulated by whoever is receiving it.
- Video Container/Resolution/Frame Rate should match (or be changed to match) the source file.

Uploading a MASTER or REFERENCE/VIEWING Deliverable to Frame.io

Frame.io is increasingly becoming an industry standard all-in-one cloud-based media management, project reviewal and active/archival storage space which works via a web-based app from a browser. It can also be installed on your computer and even integrated as a native 'plug-in' which lives within your commonly used editing applications such as *Final Cut Pro X*, *Premiere Pro*, *After Effects*, *DaVinci Resolve* and *Avid Media Composer*. It is a paid software which you can download by [clicking here](#).

Find out more about uploading to your Frame.io account [here](#).

Find out more about Creative App Integrations [here](#) (so you can directly deliver to *Frame.io* inside the editing application itself).
